

CineSphere

FLUTTER MOVIE APPLICATION

Project Documentation — ITI Summer Internship 2026 (Flutter Track)

Prepared by: Ashrakat Hassan Elsayed Helal | September 2026

1. Project Overview

CineSphere is a Flutter application for discovering and saving movies. I developed it as my graduation project during the ITI Summer Internship. The app uses TMDB to get movie data and Firebase Authentication to manage users. Users can browse movies, search for a specific movie, view its details, add movies to Favorites, and save movies to a Want to Watch list.

2. Key Features

- **Authentication** --> Register, login, logout using Firebase Authentication.
- **Home** --> Shows Popular, Top Rated, Now Playing, and Upcoming movies.
- **Movie Details** --> Shows the movie poster, title, rating, release data, genres, runtime, and overview.
- **Search** --> Search for movies using the TMDB API.
- **Favourites** --> add OR remove movies from Favorites using SQLite.
- **Want to Watch** --> Save movies that the user wants to watch later.
- **Profile** --> shows the logged-in user's email and provides access to Favorite and Want to Watch lists.

3. Technologies Used

Technology	Used For
Flutter	Building the application
Dart	Programming language
TMDB API	Getting movie data
Firebase Authentication	Register and login
Provider	State Management
SQLite	Storing Favorites and Want to Watch lists
Git & GitHub	Version control

4. Architecture

I used the **MVC pattern** to organize the project: **Models** are used to represent the application data such as Movie, **Views** contain the UI, and Controllers handle the main app logic, **Services** talk to TMDB and Firebase, and a Database layer handles SQLite CRUD for Favourites.

5. Setup Notes

- **To run the project:**
 - Install Flutter and set up the development environment.
 - Run flutter pub get.
 - Add the required TMDB API Key.
 - Configure Firebase for the Project.
 - Run the application using flutter run.

6. Known Limitations

- The Application Requires an Internet Connection To Load Movie Data From TMDB.

7. Final Checklist

- ✓ Flutter application completed
 - ✓ TMDB API integrated
 - ✓ Firebase Authentication implemented
 - ✓ Login and registration validation
 - ✓ MVC architecture used
 - ✓ Provider used for state management
 - ✓ SQLite database implemented
 - ✓ Favorites feature implemented
 - ✓ Want to Watch list implemented
 - ✓ GitHub repository and final testing
-

Thank you for taking the time to review my project. I hope you like it! ❤️
